Abstract

This project presents mathematical models to study biological systems involving bacterial infection dynamics and population growth under harvesting. Systems of ordinary differential equations are used to describe interactions between sensitive and resistant bacteria, immune response, and logistic population growth with both constant and periodic harvesting. Stability analysis identifies conditions for persistence or elimination of populations, revealing that resistant bacteria may survive treatment and that excessive harvesting can lead to population extinction. Periodic harvesting introduces time-dependent behavior that can improve sustainability when properly managed. Numerical simulations support the analytical results. Overall, the study highlights the importance of balanced parameters and demonstrates how mathematical modelling can provide valuable insights for biological control and resource management.

Table of Contents

Abstract	I
Table of Contents	II-IV
List of Figures	V
List of Tables	VI
Chapter 1: Introduction	1-5
1.1 Mathematical Modelling of Bacterial Resistance to Multiple Antibiotics and Immune System Response	1
1.1.1 Background and Motivation	1
1.1.2 Problem Statement	1
1.2 Logistic Population Models with Harvesting	2-3
1.2.1 Background and Motivation	2
1.2.2 Problem Statement	3
1.3 Objectives of the Study	3
1.4 Scope and Limitations	4
1.5 MATLAB	5
 Chapter 2: Mathematical Modelling of Bacterial Resistance to Multiple Antibiotics and Immune System Response	 7-32
2.1 Overview	7-8
2.1.1 Bacterial Infections and Antibiotic Resistance	7
2.1.2 Multiple Antibiotic Therapy	7
2.1.3 Mathematical Modelling in Infectious Diseases	8
2.1.4 Within-Host Models vs Epidemiological Models	8
2.2 Mathematical Model	8-14
2.2.1 Model Description and Assumptions	8
2.2.2 State Variables and Parameters	9
2.2.3 The Ordinary Differential Equation System	11
2.2.4 Normalization of Variables	13
2.2.5 Threshold Parameters A, B and C	14

2.3 Mathematical Analysis.....	16-18
2.3.1 Equilibrium Points	16
2.3.2 Stability Analysis	18
2.4 Results and Discussion	23-32
2.4.1 Parameter Values Used	23
2.4.2 Threshold Values A, B and C	25
2.4.3 Case I: $A < B$	26
2.4.4 Case II: $A > B$	29
2.4.5 Numerical Analysis of Model Parameters and Treatment Strategies	32
 Chapter 3: Logistic Population Models with Harvesting	 36-52
3.1 Overview	36
3.1.1 Malthusian Growth Model	36
3.1.2 Logistic Growth Model	36
3.2 Logistic Growth with Constant Harvesting	37-42
3.2.1 Model Formulation	37
3.2.2 Equilibrium Analysis	38
3.2.3 Discriminant Condition	39
3.2.4 Maximum Sustainable Yield	39
3.2.5 Stability Analysis	40
3.2.6 Parameter Table and Equilibrium Values	41
3.2.7 Results and Discussion	42
3.3 Logistic Growth with Periodic Harvesting	45-48
3.3.1 Model Formulation	45
3.3.2 Role of Parameter a	45
3.3.3 Role of Parameter b	46
3.3.4 Why No Analytic Solution Exists	47
3.3.5 Results and Discussion	48
3.4 Comparison and Sensitivity Analysis	50-52
3.4.1 Constant vs Periodic	50

3.4.2 Which Model is More Realistic	51
3.4.3 Effect of Key Parameters on Population Dynamics	52
Chapter 4: Conclusion.....	55
References.....	56
